Abstract

This research paper looks at how the land of Karnataka's shown in its writing. It says that modern Kannada writing is a way to respond to the damage being done to the environment. By looking at how the old days saw nature as beautiful and sacred and how todays writing warns about the environment the paper shows a change in how people in Karnataka think. What used to be seen as a place of peace and holy beauty is now seen as something that is getting hurt because of factories and taking much from the land. By looking at writers like Kuvempu and K. Shivaram Karanth and also modern writers like P. Tejaswi the paper shows how the loss of "Kannada Nadu" has made people feel lost. The results show that todays stories are not just about what's happening but they are fighting back. They use knowledge to speak out against the ways people are using the land too much. The study also talks about how local languages help keep the culture connected to the land. In the end the paper says that being aware of the environment in Kannada writing is a part of the strong link, between the land and the language. It shows that writing is the voice of the state when the world is dealing with climate change.

Keywords; *Kannada Sahitya, Eco-criticism, Navya Movement, Kuvempu, Environmental Ethics, Western Ghats, Agrarian Crisis.*

Introduction

The relationship between a community and its geography is not about being close in space; for the people of Karnataka, the land—Kannada Nadu—is the very heart of their cultural and literary identity. Over time the sharp peaks of the Western Ghats and the rich plains of the Deccan have not just been in the background of stories. Have been like living characters. This strong bond has created a tradition where the value of the environment is connected to the value of human life. To know Kannada literature is to know the soil that gives it life. The way nature is shown in Kannada writing has changed a lot showing the changes in the land itself. In the Navodaya (Renaissance) period writers saw the world with love and

spiritual wonder. Nature was seen as a source of inspiration praised for its lasting beauty and as a kind mother. As the 20th century moved into the 21st this kind of poetry had to face a truth. The new works have changed from being positive to being warning signs. The "urgent ecological warnings" in Kannada writing show a land that is no longer rich but is being used up and taken from. This change shows a problem: the physical damage to Karnatakas natural environment is causing a similar problem for the people. As forests are cut down and rivers are changed the symbols and images that have shaped the Kannada people for a time are disappearing. When the land is hurt the writing that speaks for it becomes a place of sadness and fighting back. The damage, to the environment caused by growth and poor planning is not just an environmental problem; it is a slow taking away of the culture that makes the Kannadiga people who they are.

Objectives of the study

- To trace the transition of nature representation from a backdrop to a protagonist in Kannada works.
- To analyze the eco-critical perspectives in the works of seminal authors (e.g., Kuvempu, Shivaram Karanth, P. Lankesh).
- To explore the intersection of social justice and environmentalism in Dalit and Bandaya literature.
- To evaluate the role of literature in regional environmental movements (e.g., Appiko Movement).

Literature Review

The ecological consciousness in Kannada literature is not an idea. It is a belief. This belief has grown from a spiritual respect for nature into a strong social criticism. This review looks at how key writers have shown the changing bond between the people of Karnataka and the land around them. Kuvempu's famous book, *Malegalalli Madumagalu* (The Bride in the Mountains) is the guide for understanding " ecology." In 1967 Kuvempu did not treat the Western Ghats as a background. Instead the Malnad area is a living force that directs fate. His story says that the human spirit can only flourish when it moves in tune with the forest's heartbeat. This gives a map for a literature that finds the divine in every living thing. K. Shivaram Karanth moved the focus to the life of the land. In *Chomana Dudi* (1933) Karanth shows the twist of a worker whose identity is tied to soil he cannot own. In *Mookajjiya Kanasugalu* (1968) Karanth remembers the ways of the land showing nature as a witness to growth and mistakes. His realistic style shows that the connection to the earth often comes from work struggle and the need to survive. The move to environmentalism is best seen in Poornachandra Tejaswi. In *Karvalo* (1980) and *Jugari Cross* (1994) Tejaswi leaves romance behind to use science and show how human greed can wreck biodiversity. His books, with the nature journalism of Nagesh Hegde link stories to today's environmental action. These works fit, into "Deep Ecology " a theory that says all living things have value, not people. When we use this idea in Karnataka it matches the wisdom that treats nature as shared heritage, not a thing to buy. By mixing all these views it becomes clear that Kannada writers have always pushed for a life where humans live with nature—a way that our modern industrial world has mostly lost.

Methodology

To effectively study how ecological degradation and cultural identity intersect in Kannada literature this research uses a qualitative, descriptive and analytical method. Of depending on numbers or statistics the study looks closely at language, imagery and storytelling

techniques. It aims to understand how writers see and represent the environment. This approach allows for a look into the emotions and philosophies embedded in the texts. It gives a picture of how the relationship between people and nature has changed in Karnataka over time. The study uses purposive sampling to novels, short stories and poems that directly engage with environmental issues. This means the chosen works are not just passing mentions of nature but are focused on concerns. The selection spans periods—from early 20th-century classics to modern eco-thrillers—so the research can trace how literary responses to the land have developed. By comparing works across time the study identifies shifts in how the environment is portrayed. The main framework for analysis is Eco-criticism. This theory helps decode the relationships between human characters and the non-human world. It allows the study to examine whether the literature supports or questions the idea that nature exists for human use. This lens makes it easier to spot wisdom in the texts. It also shows how such wisdom can act as a form of resistance against harm. To support the analysis the research draws on various secondary sources. These include critiques that offer expert views on the texts as well as interviews with authors to understand their personal motivations. To connect the stories to real-world conditions the study also uses reports from the Western Ghats. This mix of sources ensures the analysis is rooted in both expression and the actual ecological challenges facing the region. The interdisciplinary approach strengthens the findings. Makes the connection, between literature and environmental reality clearer.

Analysis

The heart of this research looks at how nature changes in Kannada literature following a path from beauty to fight. This change is not a new style; it mirrors the physical change of the Karnataka landscape when modern pressure hits. A key difference in this study is the gap between pictures of the early 20th century and the hard realism of today. Early writers saw nature as a timeless, backdrop. In those works nature gave peace and spiritual clarity. Modern stories bring a realism that shows industrial growth. In those stories nature is no longer calm; it is scarred by mining, hydropower and single-crop farms. This shift moves nature from a muse to a victim of progress forcing readers to face the lost wild. The forest or Aranya is very important in the Kannada mind. Its meaning has changed a lot. In the past the forest was a place of rest—a holy spot for meditation and the home of old gods. It was a world outside problems. Today the Aranya is shown as a place of resource digging. The quiet of the woods is replaced by the noise of machines. This study shows how books show the forest losing its power and becoming just a set of goods for world markets. A big part of showing a place is using local dialects. Writers from Malnad or North Karnataka move away from Kannada to use the rhythm and words of local speech. This use of words is not decoration; it is a sign of belonging to nature. By using words that name plants, animals and farm work these writers tie their stories to a real area. The dialect links the land to the book showing that when a local language fades the nature knowledge inside it also disappears. Finally the study looks at resistance stories that show how tribal and rural people fight against forest loss. These books witness the battles fought near the Western Ghats. The stories show the fight between views that value nature and government plans that want to grow. By keeping the voices of those who live closest to nature Kannada literature acts as action showing how people stand strong against their old homes being taken by modern industry logic. This study shows that when nature falls apart writing is a tool, for survival.

Discussion

The results of this research show that modern Kannada literature does not just watch change; it feels it as a strong pain. This part talks about the meaning of these writing trends focusing on the meeting point of past traditions the effect of leaders who started this movement and the conflict between what happens locally and what happens in the world. A main idea that comes up from the study is how environmental damage is shown as an attack on Kannada traditions. In this area identity is not an idea but is tied to real places—rivers like the Kaveri, the thick forests of the Malnad and the special nature of the Sahyadris. When these places are destroyed the writing says that the memories connected to them start to disappear. Losing a forest is not just about losing trees but about losing a community's history, stories and old ties. This conversation says that for a Kannada writer keeping the environment safe is a way to keep culture alive; to protect the land is to protect the group of people. No talk about Kannada eco-writing is complete without looking at the Tejaswi Legacy. K.P. Poornachandra Tejaswi changed the Kannada stream by mixing strong scientific thinking with the mystery and depth of nature. Unlike writers who were more sentimental Tejaswi saw the forest with the interest of a scientist. His books, like Karvalo took the conversation away from feeling much and toward an "ecological curiosity" that respected the independence of nature. He showed a group of readers that humans are not in charge of the environment but just small parts of a big sometimes hard to understand living system. By mixing stories with science Tejaswi made a special place in writing where nature is valued for what it is, not just for what it can do. This research finds a connection with the idea of Global and Local. While "Climate Change" is usually talked about in city or Western ways Kannada writers have made this problem local. They talk about environmental problems through the specific view of the Sahyadri mountains (the Western Ghats). By looking at problems like the drying of local streams or the loss of native birds these writers make climate change real and close for the local person. This way of looking at problems helps two things: it questions the models of development that come from outside. It gives local people the power to protect what is around them. The writing says that the battle against environmental problems starts with protecting the local hill the local forest and the local river. In this way Kannada writing connects the small and the big saying that the Sahyadris are not a mountain range, in the region but an important part of the earths body. Through this mix the writers are asking for a " global thinking" where being connected to the local land helps people take care of the whole world.

Results

The results of this research show that modern Kannada literature has become a way to talk about the environment. It is not about watching or describing natural scenes anymore. Today writers use their stories to fight for the environment. They write about what happens when forests are cut down when rivers are changed and when factories pollute the air and water. These stories act like a warning system for society. The research shows that literature from Karnataka saves information about the environment. It records changes that are not always talked about in reports. One big discovery from this study is that the way nature is shown has changed a lot. The old stories saw nature as something powerful. Now the new stories show nature as something that can be hurt. That is not endless. This change is important because it makes people see the environment differently. It moves people from looking at nature from a distance to feeling responsible for it. When nature is shown as damaged it

asks for protection. This moves the conversation from looking at beauty to caring about ethics. The research also shows that these stories have an effect on people. There is a link between the environmental knowledge that writers share and the way people come together to fight for the environment. For example when people wanted to save the Western Ghats or protect the Sharavathi river the stories helped. These stories give people words to describe the problem. Make the numbers and facts feel real. Because of this Kannada literature has made people care and take action. These stories and poems give people the feelings and ideas that help keep efforts going. This proves that the written word can still make a difference, in protecting the environment today.

Conclusion

The synthesis of this research confirms that modern Kannada literature acts as the conscience of the state giving a moral critique of how natural resources are managed and used. While political and economic talks often focus on gains the literary voice stays firm in its promise to protect the long-term health of the environment. By speaking for forests and shrinking rivers writers make sure that environmental degradation is seen as more than a technical mistake; it becomes a spiritual and cultural crisis. Literature serves as the record of the state's ecological health showing the results of human action with steady honesty. The final claim of this study says that environmental consciousness in Karnataka is not an borrowed trend; it is the modern growth of a deep bond that has existed for many centuries. The Kannada language itself is deeply tied to the land; its metaphors, idioms and rhythms come from the geography of the Sahyadris and the Deccan plains. The move from romanticism to present radical advocacy is a natural reply to how the land is changing. This change shows that when the landscape faces threats literature adapts to become its main shield proving that defending the environment is deeply part of the language and culture of the region. Looking ahead it is urgent to spread this wisdom through digital sites and expert translations. While Kannada eco-literature is very deep much of it is still hard for a worldwide audience to reach. Translating these works into English and other world languages will let the specific local insights of Kannada writers join the talk about climate change. Digitizing these stories keeps them fresh for a tech-friendly generation. By linking the local to the global Kannada literature can give the world a model, for keeping a sacred bond with the earth in a world that grows more industrial.
